R. Pascanu, T. Mikolov, Y. Bengio

ICML 2013

1. Introduction & Background

TODO:

1.1 Context & Motivation

- ► Importance of sequence modeling
- e.g., language, time-series in finance
- ► Identifying gradient problems (Bengio et al., 1994)
- ► Vanishing gradient problem: impossible to learn long-term dependencies
- ightharpoonup **Exploding gradient problem**: numerical instabilities ightharpoonup unstable training
- ightharpoonup Why stable gradient flow is critical for learning temporal dependencies (paper's contribution)

1.2 Schematic & formal def. of RNN

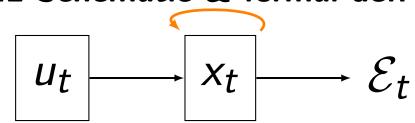

Fig. 1

$$x_t = F(x_{t-1}, u_t, \theta)$$
 (1) General $x_t = W_{\text{rec}} \sigma(x_{t-1}) + W_{\text{in}} u_t + \mathbf{b}$ (2)

where u_t : input, x_t : state, t: time step, ${f b}$: bias, ${\cal E}_t = {\cal L}(x_t)$ (error)

The recurrent connections in the hidden layer allow information to persist from one input to another.

1.3 Training RNNs: Backprop Through Time (BPTT) on Unrolled RNN

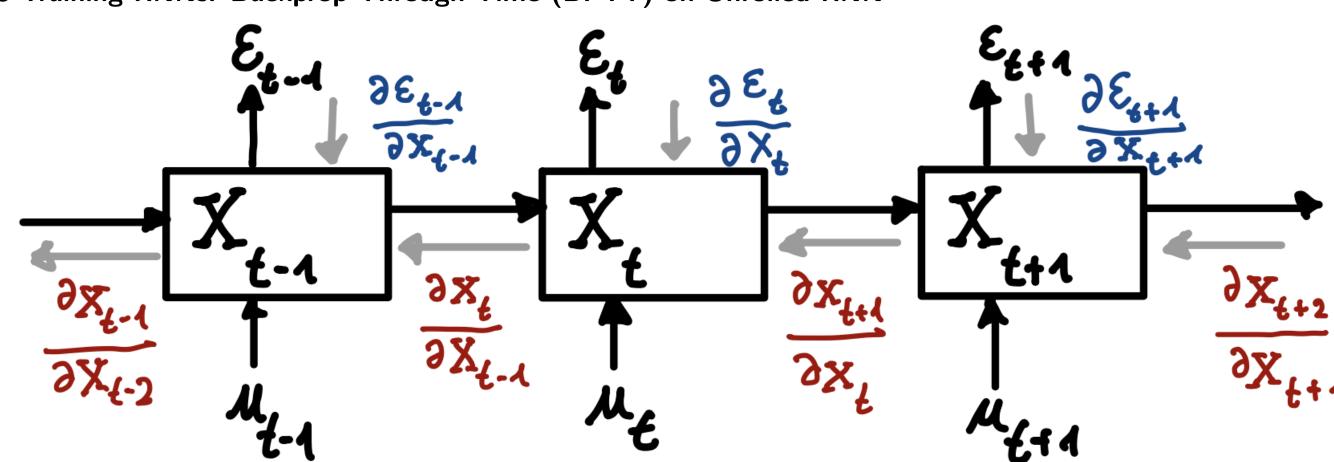

Fig. 2: Unrolled RNN

$$\frac{\partial \mathcal{E}}{\partial \theta} = \sum_{t=1}^{T} \frac{\partial \mathcal{E}_{t}}{\partial \theta} \qquad (3)$$

$$\frac{\partial \mathcal{E}_{t}}{\partial \theta} = \sum_{k=1}^{t} \left(\frac{\partial \mathcal{E}_{t}}{\partial x_{t}} \frac{\partial x_{t}}{\partial x_{k}} \frac{\partial^{+} x_{k}}{\partial \theta} \right) \qquad (4)$$

$$\frac{\partial x_{t}}{\partial x_{k}} = \prod_{i=k+1}^{t} W_{\text{rec}}^{\top} \cdot \text{diag} \left(\sigma'(x_{i-1}) \right) \qquad (5)$$

where $\frac{\partial^+ x_k}{\partial \theta}$ denotes the "immediate" partial derivative (treating x_{k-1} as constant).

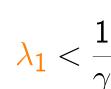

Blue: total gradient over time. Red: temporal error contribution.

2. The Problem

TODO:

2.1 Vanishing Gradient problem (VG)

Sufficient condition:

where: λ_1 : largest singular value of $W_{\rm rec}$ γ : bound on derivative of activation function

2.2 Exploding Gradient problem (EGs)

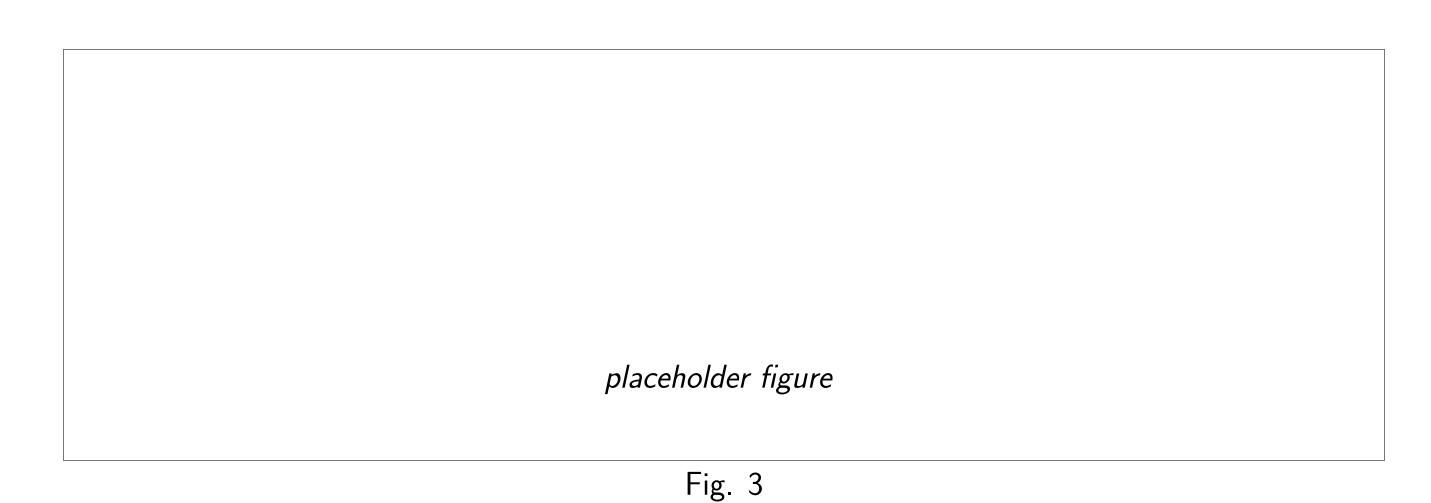

- gradients grow exponentially during backprop
- Necessary condition:

(proof: see eq. 6 & 7)

 $\lambda_1 > rac{1}{\gamma}$

2.2.1 Dynamical systems interpretation:

► EGs create steep wall-like structures that are perpendicular to exploding direction in error surface

3. Solution & Experiments

3.1 Gradient Clipping

- see Fig. 3 for motivation
- Pseudo-code for norm-clipping
- **►** TODO:

3.2 VG-Regularization

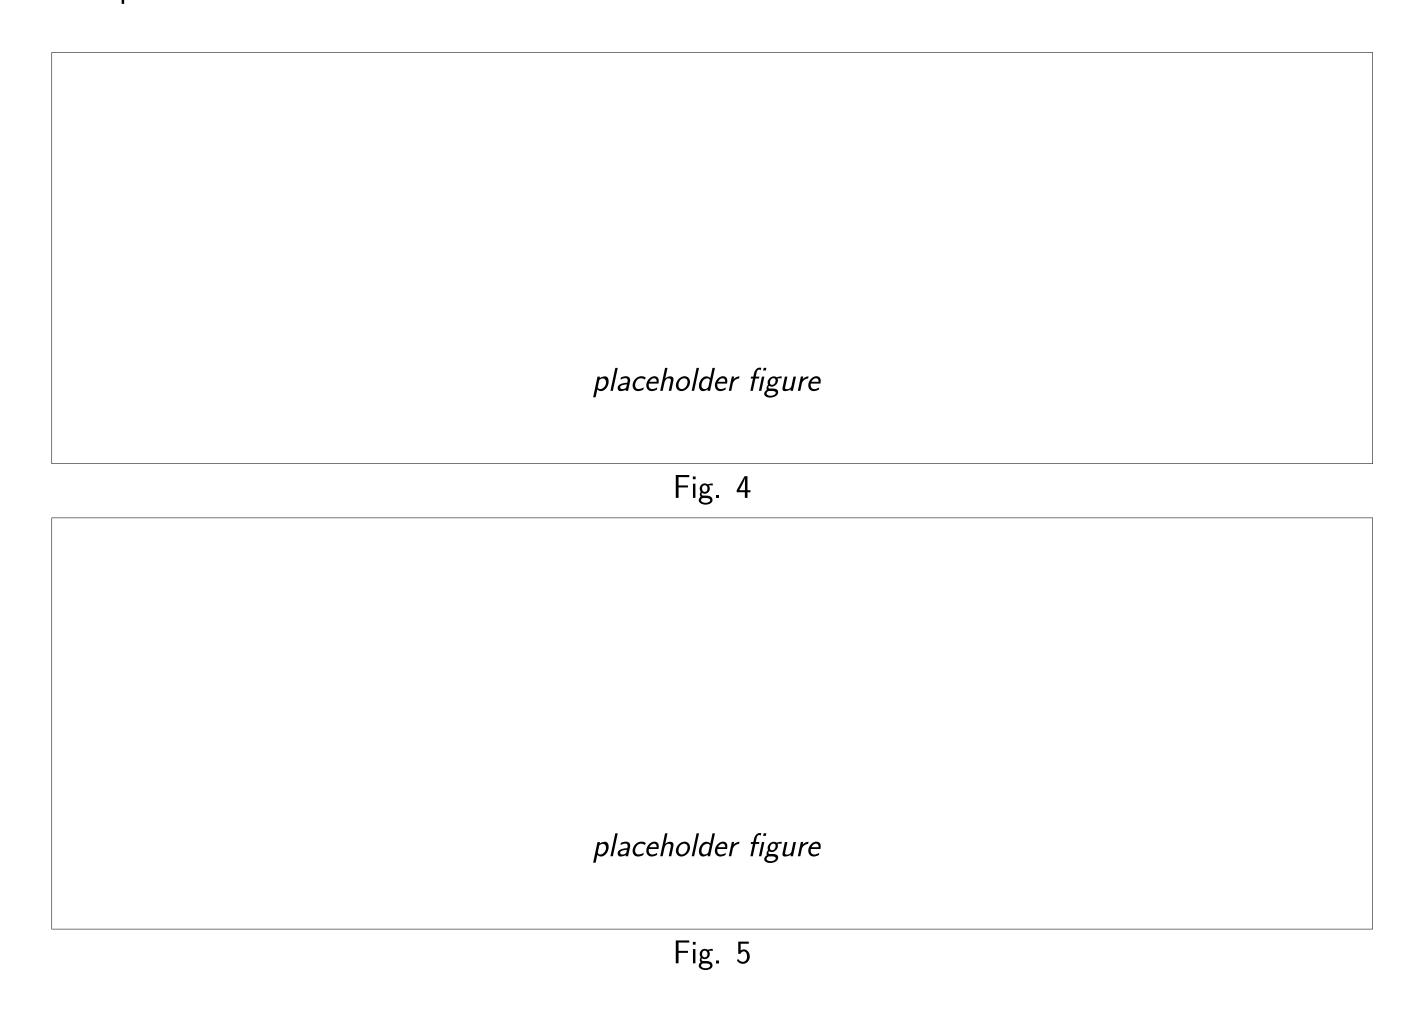

- ► see paper eq. 9 & 10
- ► TODO:

3.3 MSGD-CR

- **►** TODO:
- ► (combines 3.1 & 3.2)

3.4 Initialization Strategies

see experiments in Sec. 4

4. Relevance today & SOTA techniques

TODO:

- Clipping still relevant!
- ► Instead of regularization:
- residual connections
- gradient checkpointinggating mechanisms
- layer normalization
- attention mechanism
- positional encoding
